

PROJECT MANAGEMENT JUMPSTART

PM02.70

Most work can be organized as a project; for many organizations, the ability to successfully define and subsequently manage a project is quickly becoming a core competency. Managing a project is not easy and project management skills do not come naturally to many people.

This two-day class begins with a one-day overview of the concepts, processes and techniques associated with formal project management. Students will learn standard project management terminology as well as key capabilities such as how to create a project charter and how to determine the critical path of a project. Day two provides hands-on experience with Microsoft Office Project ("MS Project") to reinforce day one's learning by applying those concepts to the use of an industry-standard project management tool. Students will learn how to build and manage a project schedule, manage resources, create views and reports (such as critical path), as well as work with options and settings.

The course presents a unique opportunity to learn both process and tool concepts.

PREREQUISITES

- None, this class provides foundational knowledge in project management MS Project

LEARNING OBJECTIVES

At the end of this class, participants will be able to:

- Discuss the value of utilizing appropriate project management processes
